

# MSR radiation-shielding wall systems

Take advantage of our experience in the field of radiation-shielding wall systems. At MSR you will receive a concealed installation level, the finished wall system is removable at any point and at any time. This without any impairment neither in radiation protection nor in design. Shortly before the startup installation, we install the finished surface „just in time“. Subsequent to the MSR installation there is no need for any painters making the room ready-to-use.

## Variations:

- with and without door systems, elements can be expanded as wished
- lead shielding on request
- HPL coating, color according to customer requirements
- Incl. hinges and handle fittings
- Fitted cupboards can be used both-sided
- Doors incl. surrounding frames for radiation protection

## Radiation-shielding wall systems – interior construction

Of course MSR installs their wall systems also in a conventional way known from the drywall systems. The plaster boards which are used in this case are, depending on the radiation-shielding needs, equipped with the appropriate lead components.

The wall structure is a result from the required lead shielding.
